I gave this table my best shot. The option I chose was a retailer selling your personal information to others for profit. I would say this definitely exhibits dynamic behavior because if they aren't getting enough revenue they might switch thing up and do something different. Likewise, I think it is definitely a non-linear relationship because it is very anti-consumer. There is definitely interconnections and relationships as well since the company selling the data is selling it to someone else, so they have a mutually beneficial relationship. The system generates this behavior by not valuing the consumers private info.

	Stock and Flow Relationships	Acknowledging that systems are important	System as the cause of its behavior	System structure generates behavior
